Mosquito Control Report July 2024

Mr. Brian Grantham
Emergency Management Director
Rankin County
601 Marquette Road
Brandon, MS 39042

Mr. Brian Grantham,

As outlined in the Contract Document Specifications for Mosquito Control in Rankin County, MS, I am submitting the Monthly Mosquito Control Report for July 2024.

Sincerely,

Scott H. Williams, Sr.
Contract Manager
Greater Jackson Metro Area, MS

In July 2024, Rankin County, Mississippi, saw a comprehensive mosquito control effort led by Vector Disease Control International (VDCI). This narrative details the significant activities, data collection, and results as part of the ongoing mosquito surveillance and control program to protect public health from mosquito-borne diseases.

Overview of Mosquito Control Operations

The mosquito control efforts for July 2024 were thorough and consistent, as reflected in the monthly report. The operations included a combination of site investigations, treatments, and the use of various traps to monitor mosquito populations across Rankin County. The program's primary goal was to reduce the risk of mosquito-borne diseases, such as West Nile virus, by targeting both larval and adult mosquito populations. For July 2024 we covered 910 spray miles, which equals out to 33,113 spray acres treated with adulticide formulation by truck ULV spray.

Site Investigations and Treatments

During the month, the team conducted a total of 41 site investigations, with 18 of these sites found to be wet, accounting for 43.9% of the total sites inspected. The presence of water is crucial for mosquito breeding, and the data indicate that nearly half of the sites had conditions conducive to mosquito breeding. Every wet site was treated, with the team ensuring a 100% treatment rate.

The treatments involved using larvicides to eliminate mosquito larvae before they could mature into adults. This preventive approach is critical in controlling mosquito populations and reducing the likelihood of disease transmission.

Surveillance and Data Collection

Adult Mosquito Surveillance

The surveillance of adult mosquitoes was conducted using CDC light traps and gravid traps, strategically placed across various locations in Rankin County. These traps were essential in monitoring the mosquito population, particularly species known to carry diseases.

The report details the mosquito collections from multiple sites, with the traps set at regular intervals throughout the month. The data collected from these traps provided valuable insights into the mosquito species present and their abundance in different areas.

For instance, the report highlights that at the 833 Bobby Peede Street location, a significant number of mosquitoes were collected, with a total of 63 mosquitoes over two collection dates, averaging 31.5 mosquitoes per trap. Most of these were *Culex Quinquefasciatus*, a species known to be a primary vector for the West Nile virus.

Other locations, such as 200 Cemetery Road and 188 Richmond Drive, also reported high mosquito counts, emphasizing the need for continued and targeted control measures in these areas.

****Gravid Traps****

Gravid traps were used to capture mosquitoes that had already fed and were ready to lay eggs. These traps are particularly effective in targeting *Culex* species, which are more likely to be carrying diseases. The data from the gravid traps provided an additional layer of information, helping the control team to identify hotspots and adjust their strategies accordingly.

For example, the report from 358 Sand Hill Road indicated an exceptionally high number of mosquitoes captured, with a total of 103 mosquitoes over two days, averaging 51.5 per trap. This information was crucial in directing further control measures to this area, highlighting the effectiveness of the surveillance program.

Community Engagement and Public Health Impact

While the primary focus of the mosquito control program was on direct interventions, the report also emphasized the importance of community engagement. Educating the public about mosquito prevention and encouraging them to report potential breeding sites were key components of the overall strategy.

Interestingly, the report noted that there were no hotline calls related to mosquito complaints or potential habitats during July 2024. This could indicate that the community was either well-informed or that the control measures were sufficiently effective in minimizing mosquito nuisances.

****Conclusion****

The July 2024 mosquito control efforts in Rankin County were marked by a systematic and data-driven approach to managing the mosquito population. The detailed surveillance data collected through site investigations and various trapping methods provided the foundation for targeted control measures, ensuring that the risk of mosquito-borne diseases was minimized.

The comprehensive report reflects the dedication of the control team to public health and safety. By maintaining a high level of vigilance and adapting their strategies based on real-time data, they were able to address mosquito populations effectively, protecting the residents of Rankin County from potential health threats. As mosquito control remains a critical public health function, the efforts documented in this report underscore the importance of continued investment in surveillance, control, and community engagement.

Weekly Program Summary

Start Date: 07/01/2024 End Date: 07/31/2024

Rankin County

Larval Mosquito Surveillance and Control Summary

Total Number of Site Investigations:	41.0
Total Number of Sites Wet:	18.0
Percentage of Sites Wet:	43.9%
Total Number of Site Treatments:	41.0
Percentage of Sites Treated:	100.0%
Total Number of Acres Treated:	9.3

Mosquito Control Hotline Summary

Total Number of Hotline Calls:	0.0
Notify/Shutoff Calls:	0.0
Potential Habitat Calls:	0.0
Adult Complaint Calls:	0.0
General Information/Other Calls:	0.0

Adult Mosquito Control Summary

Total Number of Miles Sprayed*:	910.7
Total OZ of Adulticide Used:	25,906.1

* Only includes ULV spray-on mileage (excludes shuts, turn arounds, etc.).

* Weekly report results are based upon preliminary data and may be subject to change after final seasonal compilation.
